

# WeInfuse

## Open Position – Senior Software Developer

### You:

- Communicate effectively and work well with others
- Have 3 years of professional programming experience in general
- Have at least 1 year developing in one of our frameworks (Rails and/or Angular)
- Take pride in your work
- Are curious and enjoy learning new things

### We:

- Are a small but established SaaS startup
- Value work-life balance and developer happiness
- Mostly adhere to Scrum
- Write automated tests and use CI/CD

### What You'd Be Working On

Our product is a SaaS workflow tool for Infusion Centers. We help our clients track a million tiny details including scheduling, inventory, insurance paperwork, and clinical documentation, among others. The bottom line is the work we do helps keep patients safe and healthy, and gives our clients confidence that they'll get paid for the work they do. What we do matters, and that feels good.

Interesting problems abound working on an app that does so many things. You could find yourself tweaking an algorithm for choosing the best appointment time or building out a CRUD interface for a new resource. Or you could be integrating with a third party API for syncing patient information or interacting with an IoT device.

### Our Stack

We use Ruby on Rails (5.0) for our backend and AngularJS (1.5) for our frontend. You'll need at least a year of experience developing a production application on one of these frameworks to be successful in this position. Experience with both would be a bonus. Other technologies we use are:

- MySQL
- Redis
- json:api
- Docker
- Minitest
- Karma & Jasmine

### Our Process

We adhere to Scrum. We like the way we work, but we're always looking to improve, so we start our week with a retrospective. Then we plan out our week-long sprint, estimating how much work we can reasonably get done. Each day we check in with a standup to make sure we're on the same page and no one is blocked. We write automated tests for our code on both the frontend and the backend, and we use CI/CD to keep things running smoothly.
